Epilepsy is a common neurological problem in the elderly. While similar principles of drug selection apply to elderly individuals and to younger patients, certain factors carry greater weight. Selection of the appropriate therapy should be guided by the recognition that older patients often have comorbidity and receive multiple medications.

Antiepileptic Drugs in the Elderly - Oxford Medicine

Abstract. Antiepileptic drugs (AEDs) are routinely prescribed for the management of a variety of neurologic and psychiatric conditions, including epilepsy and epilepsy syndromes. Physiologic changes due to aging, pregnancy, nutritional status, drug interactions, and diseases (ie, those involving liver and kidney function) can affect pharmacokinetics of AEDs.
