Dental Anatomy And Physiology

Dental Anatomy. Teeth are very important to an animal as they are used for eating, grooming and defense. Consequently, dental problems, if not treated, often lead to more generalized illness. Mammals have teeth of different sizes and shapes, a condition known as heterodonty, allowing different teeth to be specialized for different tasks.

The cranium (skull) is the skeletal structure of the head that supports the face and protects the brain. It is subdivided into the facial bones and the brain case, or cranial vault ().The facial bones underlie the facial structures, form the nasal cavity, enclose the eyeballs, and support the teeth of the upper and lower jaws.
