Engineering thermoplastics and advanced engineering thermoplastics or ultrapolymers comprise a special, high-performance segment of synthetic plastic materials that offer premium properties. When properly formulated, ETP may be shaped into mechanically functional, semiprecision parts or structural components.

### Engineering Thermoplastics—Materials, Properties, Trends ...

Engineering Thermoplastics. A category of polymers that are used typically in demanding applications. They are so named because they have properties that offer higher performance (such as heat resistance) than commodity materials, and are suitable for applications that require engineering to design parts that perform in their intended use. Examples of engineering polymers include nylon, ABS, PC, PEEK, PBT, and POM.

Engineering plastics are a group of plastic materials that have better mechanical and/or thermal properties than the more widely used commodity plastics. Being more expensive, engineering plastics are produced in lower quantities and tend to be used for smaller objects or low-volume applications, rather than for bulk and high-volume ends. The term usually refers to thermoplastic materials rather than thermosetting ones. Examples of engineering plastics include acrylonitrile butadiene styrene, us
