The Vickers hardness test was developed in 1921 by Robert L. Smith and George E. Sandland at Vickers Ltd as an alternative to the Brinell method to measure the hardness of materials. The Vickers test is often easier to use than other hardness tests since the required calculations are independent of the size of the indenter, and the indenter can be used for all materials

Hardness testing of welds can be performed on any Vickers micro hardness testing machine. When hardness testing of welds, a series of measurements are made in a given pattern at a specific distance from the sample edge or top of the weld. The progression of the hardness values can then be plotted in a graph. Methods typically used: HV5 and HV10
