To evaluate the vibration of a floor system, designers must determine the floor's peak acceleration response from foot drop, since the acceleration response is one of the two prime parameters in perception of vibration. Peak acceleration is obtained from the first natural frequency of a floor. [ATC,

### VIBRATION DESIGN OF CONCRETE FLOORS

According to the UK National Annex to BS EN 1990, 30% of the imposed load should be included when considering deformation at serviceability limit state. However, this is likely to be inappropriate for floor vibrations because, in reality, the actual imposed load will be considerably less than the prescribed design loads on the floor.
