The nebular hypothesis is the leading theory amongst scientists which states that the planets were formed out of a cloud of material associated with a youthful sun, which was slowly rotating. Later in 1900, Thomas Chrowder Chamberlin and Forest Ray Moulton considered that a wandering star approached the sun. As a result, a cigar-shaped extension of material was separated from the solar surface.

CSS custom properties (CSS variables) You can instruct Nebular to use CSS custom properties. The benefit is that a theme can be changed without the need to reload the page. Moreover, no additional CSS is loaded, resulting in a good performance. The drawback is that CSS custom properties are not supported in older browsers, notably IE11.

A combination of centrifugal force, produced by the nebula's rotation, and gravitational force, from the mass of the nebula, caused rings of gas to be left behind as the nebula shrank. These rings condensed into planets and their satellites, while the remaining part of the nebula formed the sun. Advertisement.

The evolution of viscous discs and the origin of the nebular variables. - NASA/ADS. The evolution of discs under the action of viscosity is studied by both similarity solutions and Green's functions. The angular momentum is steadily concentrated onto a small fraction of the mass which orbits at greater and greater radii while the rest is accreted onto the central body.

From this photographic material, 1 new flare star and 10 new possible nebular variables in which some are rapid variables have been identified. Table 1 gives the data for the 11 variables found. The method of reduction of the photographic plates is presented and the light curves of new variables as well as their identification charts are given.
