Polar Notation :  $Z = M \angle \phi$ , where  $M$  is the magnitude of the reactance and  $\phi$  is the direction with respect to the horizontal (pure resistance) axis. For example, a resistor of 4  $\Omega$  in series with a capacitor with a reactance of 3  $\Omega$  would be expressed as 5  $\angle -36.9^\circ \Omega$ . In the descriptions above, impedance is used as an example.

Perhaps accept "Potential energy" for "Gravitational potential energy". I realize it's not entirely correct, and I did get "Gravitational Potential Energy", but I think it could be nice to accept Potential Energy for that one, since a lot of people studying mechanics would probably think of it as just "potential energy" and perhaps not spell it out in detail.

A consequence of Albert Einstein's theory of special relativity and the most famous equation in physics. This equation states that mass ( $m$ ) and energy ( $E$ ) are equivalent. The relation is very simple, only involving multiplication of mass by a very large number ( $c$  is the speed of light).
