As described in Part 1000, essential QC  
measures may include method  
calibration, reagent preparation and/or  
standardization, assessment of each  
analyst's capabilities, analysis of blind  
check samples, determination of the  
method's sensitivity [method detection  
level (MDL, limit of detection (LOD), level  
of quantification level (LOQ), or  
minimum reporting level (MRL)], and  
daily evaluation of bias, precision, and  
laboratory contamination or other  
analytical interference.

IP Standard test methods (STM) is an essential part of any quality control regime for petroleum testing laboratories. A necessary tool for the national and international testing of petroleum and petroleum products, the 2020 version of IP Standard Test Methods also enables laboratories to provide evidence of compliance with the most up to date test methods during inspections.

The Gold Standard for Examination of Water and Wastewater. This comprehensive reference covers all aspects of water and wastewater analysis techniques. Standard Methods is a joint publication of the American Public Health Association (APHA), the American Water Works Association (AWWA), and the Water Environment Federation (WEF). It is available in a printed book as well as online.

Selection depends largely on the concentration range of orthophosphate. The vanadomolybdophosphoric acid method (4500-P.C) is most useful for routine analysis in the range of 1 to 20 mg P/L. The stannous chloride method (4500-P.D) or the ascorbic acid method (4500-P.E) is more suited for the range of 0.01 to 6 mg P/L.
